

JUST WILLS

The Complete System Guide

Every screen, every user journey, every automatic step — explained in plain language

Wills Platform · CRM · HR · Finance

Version of 6 August 2026

Who this document is for.

Anyone who needs to understand what this system does — a new staff member, a manager, a tester, a client, or a developer joining the project. No technical knowledge is assumed. Where a technical name is unavoidable it is explained the first time it appears.

How to read it. Sections 1–4 explain the whole picture. Sections 5–13 follow one type of person at a time, from their first click to their last. Sections 14–20 cover the things that happen on their own, the data, and the technology.

Contents

- 1 What this system is
- 2 The people who use it (roles)
- 3 The big picture — how the four parts connect
- 4 Signing in, and where each person lands
- 5 Journey: The Client — from sign-up to a signed will
- 6 Journey: The Lawyer / Admin — turning an answer sheet into a legal document
- 7 Journey: Lead Management — from enquiry to paid customer
- 8 Journey: The Salesperson
- 9 Journey: The Account Manager
- 10 Journey: Finance — money in, money out
- 11 Journey: HR — the whole employee life cycle
- 12 Journey: The Employee — booking leave
- 13 Journey: The Superadmin — creating accounts
- 14 Things the system does on its own (automations)
- 15 Email: how messages leave the system
- 16 Documents and PDFs
- 17 Languages: English and Arabic
- 18 The data — every table, in plain words
- 19 The technology, and how the code is arranged
- 20 Known limits and things to be careful about
- 21 Quick reference — every page and every address

How to read the flow charts

Every chart in this guide uses the same five shapes.

1 What this system is

Just Wills is a UAE business that writes legal wills for people living in the Emirates. This system is the whole business, running as one website.

It does four jobs that are normally four separate products:

Part	What it is for, in one sentence
The Wills product	A customer answers a long questionnaire about their family and their money, and the team turns those answers into a legal will document that the customer signs.
Lead Management (CRM)	Everyone who enquires is recorded, chased, quoted, invoiced and either won or lost — nobody is forgotten.
Finance	Every dirham that comes in or goes out is recorded, and unpaid invoices are chased automatically.
HR	Staff records, visas and passports, attendance, holidays, performance scores and reviews.

The one-line story of the business

Two kinds of will

The customer chooses one at the start, and it changes what the document says (not the questions asked):

- **General will** — "everything I own goes to these people". Simpler.
- **Specific will** — "this flat goes to X, this bank account goes to Y". Each item is named.

Separately, every will is written for one of two emirates — **Dubai** or **Abu Dhabi** — because the two courts use different legal wording (age of adulthood, which court has authority, and the attestation block at the end).

2 The people who use it (roles)

Everybody who logs in has one or more **roles**. A role decides which menu they see and what they are allowed to do. There are eight.

Role	Who it is in real life	What they can do
client	A paying customer	Fill in the will questionnaire, watch its progress, download documents, sign, ask for changes, contact support.
admin	The lawyer / operations manager	See every will, review them, generate and release drafts, finalise, email executors and guardians, plus a read-only view over HR, Finance and Leads.
superadmin	The system owner	Only one job: create, disable and delete user accounts and hand out roles.
hr	HR officer	Staff records, documents, attendance, holidays, KPIs, reviews, HR settings.
finance	Accountant	Income and expenses, invoices, unpaid balances, financial reports.
lead_management	Sales manager	All leads, all salespeople, quotes and invoices, sources, and the rules that run the sales process.
salesperson	Sales agent	Only the leads assigned to them, their own calendar, their own numbers.
account_manager	Case handler	Only the wills assigned to them — the same screens as admin, filtered down.

Two levels inside a role: Head and Employee

Four of the roles (HR, Finance, Lead Management, Admin) come in two strengths. An **Employee**-level user can do the day-to-day work. A **Head**-level user can also do the destructive or policy-setting things.

Role	Head-only actions
HR	Deactivate an employee · delete a department · delete a job role · archive a KPI · change leave approval rules
Finance	Delete a transaction · change finance settings
Lead Management	Delete a lead · delete a lead source
Admin	Critical admin operations

A **superadmin** is always treated as Head everywhere.

One person, several roles

A user can hold several roles at once — for example HR *and* Finance. When they do, a **role switcher** appears in the top bar. Picking a role changes the whole left-hand menu. The work areas do not change; only what

they are allowed to see does.

WHAT HAPPENS WHEN A MULTI-ROLE USER SWITCHES ROLE

3 The big picture — how the four parts connect

The four parts are not four separate systems. They share one customer, one invoice and one set of accounts. This is where they touch each other.

The four shared "objects" everything hangs off

Object	What it is	Who touches it
Lead	A person or company who might buy. Holds their contact details, status, owner, notes, calls and quotes.	Salesperson, Lead Manager, Finance (for the money on it)
Proposal / Invoice	The quote. Once it is sent for payment it is also the invoice. Holds the line items and the total.	Sales creates it, Finance sees the money, the customer pays it
Will	One customer's answers plus every document produced from them.	Client fills it, Admin/Lawyer works it, Account Manager owns it
Employee	A member of staff. Holds documents, attendance, leave balance, KPI scores and reviews.	HR manages it, the employee sees their own leave

IMPORTANT CONNECTION

A **Lead** becomes a **Client** when a member of staff clicks "Create client account" on the won lead. That single click makes the login, emails the password, and from that moment the same person exists twice: as a lead (sales history) and as a client (their will). They are linked by email address.

4 Signing in, and where each person lands

There are several front doors, all leading to the same building. Which door you use only decides which sign-in screen you see; your role decides where you end up.

Door (web address)	Meant for
/login	The general sign-in page
/client/auth	Customers
/client/auth/signup	A customer creating their own account
/admin/auth	Lawyers, admins, salespeople, account managers
/hr/auth	HR staff
/finance/auth	Finance staff
/lead-management/auth	Sales managers
.../auth/reset	Forgot-password, one per door

Where each role lands after signing in

Role	Landing page	Why
superadmin	/admin/manage-users	Their only job
admin	/admin	The wills overview
hr	/admin/hr	HR dashboard
finance	/admin/finance	Money dashboard
lead_management	/admin/lead-management/leads	The pipeline
salesperson	/admin/lead-management/leads	Same pipeline, filtered to their own leads
account_manager	/admin/wills	Their assigned cases
client	/client	The customer portal

If a user holds several roles, the system picks the strongest one in this order: superadmin → admin → hr → finance → lead management → salesperson → account manager → client.

WORTH KNOWING

The check that keeps people out of pages they should not see runs *in the browser*, not on the server. It is a guard component wrapped around each area. It works for normal use, but it is not a security wall — see section 20.

5 Journey: The Client

This is the longest journey in the system, and the one the customer actually pays for.

5.1 Getting an account

There are two ways in.

5.2 The customer's home screen

At `/client` the customer sees, at a glance:

- A big status banner telling them exactly where their will is right now, in their own words.
- A count of their wills and of their available documents.
- A "continue where you left off" prompt if they started the questionnaire and stopped.
- A recent-activity list, built from the real history of status changes.
- A download button for the final PDF once there is one.

The left menu has five items: Home, Create/Edit Will, My Documents, Support, Settings.

5.3 The will questionnaire — 11 steps

This is at `/client/will`. It is one long form split into eleven steps with a numbered bar across the top.

Everything saves automatically as you go, so the customer can close the browser and come back days later.

#	Step	What the customer is asked for
1	Personal Details	Full name, date of birth, nationality, marital status, address, contact details, and the choice of will type (general or specific) and emirate (Dubai or Abu Dhabi).
2	Identity Upload	Photos or scans of passport, visa and Emirates ID. The system can read the numbers off the picture automatically. There is also a camera option to take the photo there and then.
3	Beneficiaries	Who inherits. Each one has a name, relationship, contact details, and can have their own ID document attached. Beneficiaries are either "residue" (a share of everything left) or "specific" (a named item).
4	Assets	What they own, in seven categories: property, bank accounts, investments, business, vehicles, crypto, personal items. Photos and ownership documents (title deeds, log books, statements) can be attached to each.
5	Executors	Up to three people, in order of preference, who will carry out the will. Name, relation, email, phone, passport.
6	Trustees	Up to three people who hold money for children until they grow up. This step can be skipped entirely.
7	Interim Guardians	Who looks after the children in the first hours and days. These are usually people already in the UAE.
8	Permanent Guardians	Who raises the children long-term.
9	Receipt & Disinheritance	Who receives the physical will document, and any person the customer wants to deliberately leave out.
10	Family Exclusion & Letter of Wishes	Formal exclusions, plus a free-text personal letter that sits alongside the will but is not legally binding.
11	Review & Confirm	Everything on one page, with an Edit link back to each section, tick-box confirmations, and the Submit button.

JOURNEY — FILLING IN THE QUESTIONNAIRE

SMALL DETAILS THAT MATTER

The step numbers along the top are clickable, but only for steps already visited. Each number carries its own little badge: a green tick (saved), a spinner (saving right now), or a red number (that many problems). Uploading a document shows a progress bar, and a poor connection is detected and reported rather than silently losing the file.

5.4 Watching the will progress

After submitting, the customer's home screen banner follows the will through six states. The customer sees a friendly version of each.

Movement backwards is possible but only for an admin, and only with a written reason — for example pulling a released draft back to "Draft Ready" to correct a mistake.

5.5 Asking for a change

JOURNEY — THE CUSTOMER WANTS SOMETHING CHANGED

5.6 Signing

Once a will is **Finalised**, the customer can sign it on screen with their finger or mouse.

JOURNEY — SIGNING THE WILL

WHY A SEPARATE COPY

The final document is usually hand-edited in Word by the team before being uploaded. Rebuilding it from the answers would throw those edits away, and stamping a signature onto an unknown layout could land on top of the court's own text. Appending a fresh page is the only safe option, and it leaves two clean files: unsigned and signed.

5.7 Documents, support and settings

- **My Documents** (</client/documents>) — every file for the customer: their uploads, drafts, final and signed wills. Each has its own detail page with a preview and download.
- **Support** (</client/support>) — a message form that emails the team.
- **Settings** (</client/settings>) — name, password, and the choice of English or Arabic.

6 Journey: The Lawyer / Admin

The admin's job is to turn a customer's answer sheet into a legal document, and to keep the queue moving. Their home is `/admin`.

6.1 The wills queue

`/admin/wills` is a table of every will in the business, with filters by status, will type, emirate, date and search by customer name. Each row shows the customer, the status badge, when it was submitted, and who the account manager is.

6.2 Inside one will

At `/admin/wills/[id]` the admin has:

- **The answers** — every question and answer, section by section, in a readable panel.
- **The documents** — everything the customer uploaded, with thumbnails and previews.
- **The status control** — the next allowed step, with a confirmation box that asks for a note when moving backwards.
- **Generate from template** — builds the draft document from the answers using the correct emirate's legal wording.
- **Upload a PDF** — for when the document has been finished by hand in Word.
- **The history** — every status change, who did it and when, plus internal notes such as logged edit requests.
- **Notification buttons** — send an email to the executors, the trustees, the interim guardians or the permanent guardians, telling them they have been named.
- **Print view** (`/admin/wills/[id]/print`) — the page that produces the properly formatted document, including Arabic.

JOURNEY — PRODUCING THE WILL DOCUMENT

6.3 Wills reports

</admin/wills/reports> shows volume over time, the breakdown by status, by will type and by emirate, and how long wills spend at each stage.

6.4 What else the admin can reach

The admin menu also carries a copy of every other department, under </admin/hr/...>, </admin/finance/...>, </admin/lead-management/...> and </admin/salesperson/...>. These are the same screens described in sections 7–11. There is also **My Leave** at </admin/my-leave>, because an admin is also a member of staff.

7 Journey: Lead Management

This is the sales engine. Everything from "someone got in touch" to "they paid" lives here.

7.1 The four ways a lead gets in

7.2 Who gets the lead — the three assignment rules

Set once in Settings → Team, and applied to every new lead:

Rule	How it works
By source	Each source (Facebook, referral, walk-in...) has a list of salespeople attached to it. Leads from that source go to those people.
Round robin	Leads are handed out evenly, one after another, so everyone gets the same number.
Manual	Nobody is assigned automatically; a manager assigns each one by hand.

A lead has one main owner and can also have **co-assigne**es who see it too.

7.3 The twelve statuses of a lead

The statuses are not a fixed ladder — a salesperson picks whichever one matches reality. Every change is written to the lead's history, and fires a notification.

7.4 The daily work on a lead

Opening a lead ([/admin/lead-management/leads/\[leadId\]](/admin/lead-management/leads/[leadId])) gives:

- **Communications** — log every call, email, WhatsApp or meeting, with the outcome (answered, no answer, voicemail, busy, wrong number).
- **Notes** — free text, added and edited by anyone on the lead.
- **Reminders** — "call this person on Thursday". They pop up when due.
- **Documents** — files attached to the lead.
- **History** — a full timeline of everything that ever happened.
- **Health indicator** — a warning when a lead has gone quiet for too long.
- **Quick actions** — send a quote, send an invoice, change status, set a reminder.

7.5 Contact cadence — the automatic chase

JOURNEY — WHAT HAPPENS WHEN A CUSTOMER WILL NOT ANSWER

Both the number of attempts and the gap between them are settings, not fixed numbers.

7.6 Quote → invoice → payment

JOURNEY — GETTING PAID

WHY THE PAYMENT LINK IS CLEVER

The link inside an email or a PDF cannot change once it is sent — but the amount owed can, because the customer might pay part of it by bank transfer next week. So the link does not point at a fixed payment page. It points at the system, which works out the balance at the moment the customer clicks, and only then creates the payment. If the invoice has already been settled, the customer sees a "nothing to pay" page instead of being charged twice.

7.7 The five Settings tabs

Tab	What it controls
Account	The signed-in user's own details and password.
Notifications	Which events send an alert, and how often — instantly, a daily digest, or a weekly digest.
Templates	The wording of the emails sent to leads: subject and body, editable, with a test-send button.
Automation	The rules that run by themselves: how many days before a quiet lead is flagged as stale, the contact-cadence attempts and gap, and whether managers are alerted when a deal is won.
Team	The assignment method (by source / round robin / manual) and the working hours used for scheduling.

7.8 Sources, reports and analytics

- **Sources** (</lead-management/sources>) — create and edit where leads come from, and attach salespeople to each one.
- **Reports** — volumes, conversion, and performance per salesperson.
- **Analytics** — the conversion funnel, revenue charts and a pipeline board where leads can be dragged from one status column to the next.
- **Salesperson pages** — open one person and see all their leads and their numbers.
- **Export** — leads can be exported to a spreadsheet with the chosen filters applied.

8 Journey: The Salesperson

A salesperson uses the same pipeline as the sales manager, but sees only the leads assigned to them. Their menu has four items: My Leads, Calendar, My Leave, Settings.

The calendar

</admin/salesperson/calendar> shows every meeting and reminder on a month view. Clicking a day opens everything scheduled for it. Meeting invitations produce a proper calendar file the customer can add to Outlook or Google.

Reports and settings

Their own conversion numbers and lead counts; and a settings page for their own account, including connecting their Outlook mailbox so emails go out under their own name.

9 Journey: The Account Manager

An account manager is the named person looking after a particular customer's will. They see the same wills screens the admin sees, but the list is filtered to only the wills assigned to them.

Their menu is deliberately short: My Cases and My Leave.

10 Journey: Finance

Finance answers three questions: what came in, what went out, and who still owes us money.

10.1 The dashboard

[/finance](#) (or [/admin/finance](#)) shows:

- **Headline cards:** total income, total expenses, net position, collected revenue.
- **Charts** of income and expenses over time, and by category. Clicking a chart segment filters the table below it.
- An **Outstanding Balances** card listing every invoice that is not fully paid.
- **Tabs** for transactions and for invoices.

10.2 Recording money

Editing is open to any finance user. **Deleting** is Head-level only.

10.3 Invoices and part-payments

Invoices are the quotes raised by the sales side. Finance can view any invoice, download its PDF, and record a payment against it.

JOURNEY — A CUSTOMER PAYS PART BY BANK TRANSFER

10.4 Chasing what is owed

Every **Monday morning** the system emails a digest of every unpaid balance to the people set in Finance Settings. The day and recipients are configurable, and it can be switched off.

10.5 Reports

</finance/reports> gives period comparisons, category breakdowns, and exports of both transactions and invoices to spreadsheet.

NOTE ON THE REVENUE CHARTS

Revenue is currently grouped by the month the *lead* was created, not the month the money actually arrived. In practice these are almost always the same month, so the charts look correct today — but it is a known simplification, listed in section 20.

11 Journey: HR

HR is the largest area by number of screens. It covers a member of staff from the day they are hired to the day they leave.

11.1 Employees, departments and job roles

- **Employees** — a searchable table; add, view, edit, deactivate. The profile page holds personal details, job, manager, salary band, documents, attendance, leave and KPI history.
- **Departments** — the list of departments. Deleting one is Head-level only.
- **Job roles** — job titles, each with its own set of KPIs attached, so a new hire inherits the right measures automatically.
- Employees can be exported to a spreadsheet.

11.2 Documents and expiry alerts

JOURNEY — A VISA IS ABOUT TO EXPIRE

There is also a **daily digest** that lists everything expiring soon in one email, and a batch export of documents.

11.3 Attendance

Each day for each employee is one of six states: **present** **late** **working from home** **on leave** **sick leave** **absent** .

- A month calendar, colour-coded, with a legend. Clicking a day opens the detail for it.
- A per-employee attendance page with their own history and summary.
- An alerts card highlighting repeated lateness or absence.
- **Send warning** — a formal warning email, recorded against the employee.
- Export attendance for a chosen period, and an emailed attendance summary.
- Public holidays are recognised so they are not counted as absence.

11.4 Leave — the multi-step approval

This is the most intricate flow in HR. Leave is not one click by anyone in HR; it follows a chain of approvals defined by rules.

JOURNEY — A LEAVE REQUEST, END TO END

HOW MANAGER, HR AND DIRECTOR ARE DECIDED

There is no "manager" or "director" login type. "Manager" means the person recorded as this employee's manager, followed through to their own login. If the employee has no manager on file, or their manager has no login, the step falls back to HR/admin so a request can never get stuck with nobody able to approve it. "Director" means admin or superadmin.

Other leave screens:

- **Balances** — how many days each employee has, per leave type, with the used, pending and remaining figures.

- **Calendar** — who is away, when, across the whole company.
- **History** — every past request, per employee.
- **Pending approvals widget** — what is waiting on the signed-in person right now.
- **Analytics** — patterns in leave taking, including an automatic analysis job.
- **Export** — leave for a chosen period, to a spreadsheet.

11.5 KPIs — measuring performance

Old KPIs are **archived** rather than deleted, so past scores still make sense. Archiving is Head-level only.

11.6 Reviews

Type	What it is
Monthly review	A short check-in: what went well, what did not, what to do next month.
Quarterly review	The full review. Pulls in the three monthly reviews and the KPI scores, adds ratings and comments, and produces a PDF.
Templates	HR designs the questions once; every review uses them.
Compliance	A dashboard showing who has and has not been reviewed, so nobody is missed.

Each review moves through four states: **draft** **submitted** **approved** **complete** .

11.7 HR settings – five tabs

Tab	What it controls
Account	The signed-in HR user's own details.
Notifications	Which HR emails go out, to whom, and when.
Leave Approvals	The rules: which leave type, how many days, which of manager/HR/director must approve, how many days before escalation, and the priority when two rules could match.
Leave Types	The list of leave types, their yearly allowance, colour, icon, and whether a certificate is required.
Review Templates	The questions used in monthly and quarterly reviews.

There is also an **Email Logs** page (</hr/settings/email-logs>) recording every HR email the system tried to send, and whether it was sent, failed or skipped.

11.8 HR reports

Headcount, department breakdown, attendance summaries, leave usage and KPI performance, all exportable.

12 Journey: The Employee (self-service)

Every internal user — HR, finance, sales, admin — is also a member of staff, so every internal menu has **My Leave** in it (</my/leave> or </admin/my-leave>).

WHY DAYS ARE RESERVED IMMEDIATELY

If the balance were only deducted at approval, an employee could request their entire allowance three times over while all three sat waiting. Reserving on submission and only *committing* on final approval prevents that, and a denial hands the days straight back.

13 Journey: The Superadmin

The superadmin has exactly one page: </admin/manage-users>. It is deliberately narrow — the person who can create accounts should not also be working inside the data.

JOURNEY — BRINGING A NEW STAFF MEMBER ONTO THE SYSTEM

JOURNEY — SOMEONE LEAVES

14 Things the system does on its own

A large part of the value here is what happens when nobody is looking. These are scheduled jobs that wake up on a timetable.

Job	When it runs	What it does
Lead reminders	Every minute	Fires reminders the moment they fall due.
Proposal follow-ups	Every 5 minutes	Chases quotes that have been sent but not paid.
Lead notification flush	Every 15 minutes	Sends out the queued lead alerts in a batch.
Document threshold alerts	Every 15 minutes	Warns when a staff passport, visa or ID crosses a warning window. Each threshold fires once only.
KPI notifications	Every hour	Reminds managers that an evaluation is due or incomplete.
Stale lead reminders	Daily, 03:30	Flags leads that have gone quiet for longer than the setting allows.
Lead daily digest	Daily, 04:00	A summary email of the day's lead activity.
Lead weekly digest	Mondays, 04:00	The weekly version.
Outstanding balance digest	Mondays, 04:00	Lists every invoice still owing.

Alongside those, these run when something specific happens rather than on a clock:

Job	Triggered by
Create client / dashboard user	Staff clicking "create account" on a won lead
Notify executors	The admin pressing the notify button on a will
Extract passport number	A passport image being uploaded
Will PDF request / callback / release	Draft generation and release
Leave escalation processing	An approval step sitting untouched too long
Leave pattern analysis	The analytics page being opened
Document expiry digest	The daily HR summary
Support / edit-request email	A customer using those forms
Payment confirmation	The card provider telling the system a payment succeeded

HOW A CARD PAYMENT GETS CONFIRMED – WITHOUT ANYONE CLICKING ANYTHING

Customer completes payment on the card page

The payment provider calls the system directly with a signed message

The system checks the signature is genuine

The payment is recorded against the invoice

Do all payments together now cover the invoice total?

NO

YES

Stays "Sent" – the balance keeps being chased

Marked "Paid"

Meanwhile the customer sees a success page

15 Email: how messages leave the system

There are two ways an email can go out.

Connecting Outlook

From their settings page a user clicks Connect, signs in to Microsoft, and grants permission. The connection can be checked or disconnected at any time from the same card.

Test mode

The system has a test mode that redirects outgoing mail to a single test inbox, adding the intended recipient to the subject line so it is clear who it was meant for.

READ THIS BEFORE GOING LIVE

Test mode does **not** cover everything. Mail sent through a connected Outlook mailbox goes to the real recipient regardless. A handful of HR alerts and the document-threshold alert also bypass it. Section 20 lists exactly which ones.

What emails exist

Area	Emails sent
Clients	Welcome with login details · account confirmation · password reset · draft released · finalised · support replies
Wills	Notifications to executors, trustees, interim guardians and permanent guardians · edit-request notice to the team
Leads	New lead assigned · status changed · deal won (to managers) · quote sent · quote follow-up · invoice · stale lead · daily and weekly digests · meeting invitations
Finance	Invoice with a pay-now link · weekly outstanding balance digest
HR	Leave approved · leave denied · leave escalation · document expiry digest · document threshold alert · individual document reminder · attendance warning · attendance summary · KPI monthly reminder · KPI quarterly report · KPI incomplete reminder

16 Documents and PDFs

The system produces a lot of paperwork. These are the documents it can create.

Document	Made where	Notes
Will draft (PDF)	Admin → Generate from template	Uses the Dubai or Abu Dhabi legal wording
Will draft (Word)	Same action	So the team can hand-edit before finalising
Signed will	Client signs	The final file plus one appended signature page
Proposal / quote PDF	Sales	Branded, with line items
Invoice PDF	Sales / Finance	Includes a pay-now link; an Arabic version exists
KPI report	HR	Per employee, or a bulk download for a team
Department KPI summary	HR	With charts
Quarterly review	HR	Ratings, comments and custom fields
Spreadsheet exports	Everywhere	Leads, transactions, invoices, employees, attendance, leave, documents

ONE THING TO KNOW ABOUT WILL PDFS

There are four different pieces of code in the project that can produce a will PDF, left over from earlier attempts. Only one is actually used in practice — the printable page at `/admin/wills/[id]/print` — and it is the only one that renders Arabic correctly. The other three should be treated as dead code, not as options.

Watermarking

Drafts can carry a watermark so an unapproved document is never mistaken for the final one.

17 Languages: English and Arabic

The whole system runs in two languages. A switcher in the top bar changes it instantly, and the choice is remembered against the user's account.

Translations are kept in two dictionaries, one per language, split into groups (common, admin, HR, finance, leads, portal, form, salesperson). A checking script exists to find keys that are present in one language but missing in the other.

One deliberate exception: the public enquiry form always displays in light mode, ignoring the visitor's dark-mode preference, so it always looks the same to a member of the public.

18 The data — every table, in plain words

There are 44 tables. This is what each one holds.

People and access

Table	Holds
profiles	One row per person who can sign in: name, email, language.
user_roles	Which roles each person has, and whether they are Head or Employee level.
finance_roles	An extra, finance-specific permission list.
user_identity_documents	A customer's passport, visa and Emirates ID, plus the numbers read from them.
user_outlook_connections	The link between a user and their connected Microsoft mailbox.

Wills

Table	Holds
wills	One row per will. Contains the status, the will type, the emirate, the account manager, the file paths, and all of the customer's answers in a single field .
will_status_events	Every status change: from, to, who, when, and internal notes.
will_document_versions	Every version of the document produced, so nothing is lost.

WHY THERE IS NO "BENEFICIARIES" TABLE

Beneficiaries, executors, guardians, trustees and assets are *not* separate tables. They all live inside the single answers field on the will, stored as structured text. This makes the form flexible and easy to change, but it means you cannot, for example, run a database query for "every will naming this person" without reading through the answers.

Leads and sales

Table	Holds
leads	The main record: contact details, status, source, owner, value.
lead_assignments	Co-assignees — extra people who share a lead.
lead_communications	Every call, email and meeting logged, with its outcome.
lead_notes	Free-text notes.
lead_reminders	Scheduled follow-ups, and whether they have fired.
lead_sources	Where leads come from.
source_salesperson_assignments	Which salespeople are attached to which source.
lead_notification_events	The queue of alerts waiting to be emailed.
communication_methods	The configurable list of contact methods.

Money

Table	Holds
proposals	Quotes and invoices: line items, total, status (draft / sent / paid / cancelled), when invoiced.
proposal_payments	Each individual payment against an invoice — card or bank transfer — with its external reference.
finance_transactions	Income and expenses, with type, category, amount, date and attachment.

Staff

Table	Holds
employees	The staff record, including who their manager is and which login it belongs to.
departments	Department names.
job_roles	Job titles.
employee_documents	Staff documents with expiry dates and which alerts have already been sent.
attendance	One row per employee per day, with its state.
attendance_warnings	Formal warnings issued.

Leave

Table	Holds
leave_requests	The request: dates, type, status, and where it is in the approval chain.
leave_types	Annual, sick, unpaid and so on — with allowance, colour and whether a certificate is needed.
leave_balances / employee_leave_balances	Days available, used and pending — the second one is per leave type.
leave_approval_rules	The rules: which type, how many days, who must approve, escalation timing, priority.
leave_approval_steps	The actual chain for one request, step by step, with decisions.
leave_approval_delegations	Who may act on someone else's behalf while they are away.
leave_analytics_results	The output of the leave-pattern analysis.

Performance

Table	Holds
kpis	The measures, with targets and weights.
kpi_evaluations	Scores given against them.
employee_custom_kpis	Measures that apply to one individual only.
custom_kpi_evaluations	Scores for those.
monthly_reviews	The short monthly check-ins.
quarterly_reviews	The full quarterly reviews.
review_templates	The question sets used by both.

System

Table	Holds
system_settings	Every configurable setting, in one place.
email_notification_logs	Every email attempt: type, recipient, result, and extra detail.

Fixed lists the database enforces

List	Allowed values
Roles	client · admin · hr · finance · lead_management · superadmin · salesperson · account_manager
Permission level	head · employee
Will status	in_progress · awaiting_review · under_review · draft_ready · draft_released · finalized
Lead status	not_started · contacted · consultation · pending · won · lost · meeting · hold · qualified · negotiation · consultation_completed · unreachable
Call outcome	answered · no_answer · voicemail · busy · wrong_number
Proposal status	draft · sent · paid · cancelled
Attendance	present · late · wfh · on_leave · sick_leave · absent
Leave status	pending · approved · denied
Review status	draft · submitted · approved · complete
Reminder status	pending · triggered · done · dismissed
Transaction type	earning · expense
Transaction category	consultation_fee · service_fee · other_income · salary · rent · utilities · marketing · software · office_supplies · travel · legal · taxes · other_expense
Notification type	document_expiry_digest · individual_reminder · leave_approval · leave_denial · kpi_quarterly_report · kpi_incomplete_reminder · kpi_monthly_reminder · document_threshold_alert
Email result	sent · failed · skipped
Language	en · ar

19 The technology, and how the code is arranged

Piece	What it is
Next.js + React + TypeScript	The website itself — both the screens and the server behind them.
Tailwind CSS + shadcn/ui + Radix	The look, and the ready-made building blocks (dialogs, tables, menus).
Supabase	The database, the sign-in system, the file storage, and small server programs called edge functions.
Stripe	Card payments.
Microsoft Graph (Outlook)	Sending email from a user's own mailbox.
Resend	Sending email from the company address.
pdf-lib · docx · html2pdf	Producing PDFs and Word documents.
TanStack Query	Fetching and caching data on screen.
react-hook-form + Zod	Forms and their validation rules.
Recharts	The charts.
TipTap	The rich-text editor used for proposals.
i18next	The English/Arabic switching.
Vercel	Where the site is hosted.

The folder layout

Folder	What lives there
<code>src/app/</code>	Every page, one folder per web address. Folders in brackets, like <code>(hr)</code> , group pages without appearing in the address.
<code>src/app/api/</code>	The server endpoints the screens call — 65 of them.
<code>src/components/</code>	Reusable pieces, grouped by area: will-form, hr, finance, lead-management, admin, ui.
<code>src/lib/</code>	The rules and calculations, kept away from the screens: PDF building, balances, leave approval, email templates.
<code>src/hooks/</code>	Shared behaviour: signing in, permissions, file upload, camera, form state.
<code>src/types/</code>	The shapes of the data.
<code>src/config/</code>	The dashboard and menu definitions, and company details.
<code>src/locales/</code>	The English and Arabic dictionaries.
<code>supabase/migrations/</code>	142 files describing every database change ever made.
<code>supabase/functions/</code>	24 small server programs for scheduled and background work.
<code>scripts/</code>	Maintenance tools: create an admin, grant roles, check translations, seed demo data.

The duplicated portals

HR, Finance and Lead Management each exist at two addresses: their own (`/hr/...`) and inside the admin menu (`/admin/hr/...`). Most of the admin copies are one-line pointers at the original, so a change in one place shows in both. **But not all of them.** The employees pages and the finance reports page are genuine separate copies that have drifted apart over time.

FOR DEVELOPERS

Before fixing a bug in an HR or Finance screen, check which of the two kinds you are in. If it is a real copy, the same fix is needed in both places.

20 Known limits and things to be careful about

An honest list. None of these stop the system working; all of them are worth knowing before going live or before making changes.

Security

- **The database's own row-level security is switched off.** A migration disabled it across 26 tables, and only some were re-enabled afterwards. Do not assume a query is protected by the database itself.
- **The access check runs in the browser, not on the server.** There is no server-side gatekeeper file; the protection is a component wrapped around each area. It is enough for normal use, not for a determined attacker.
- **26 of the 65 server endpoints use the master database key without checking who is calling.**

Email — before go-live

- Mail sent through a **connected Outlook mailbox reaches the real recipient today**, test mode or not.
- The **document threshold alert** emails its configured recipient directly, bypassing test mode.
- **Five HR endpoints** — the KPI report, document reminder, attendance warning, leave notification and attendance summary — are hard-wired to send to the admin address with only a code comment as a reminder to change it. Going live means editing those five by hand.
- **Nine accounts currently hold the sales manager role**, several of them test logins. Every "deal won" alert and every digest goes to all nine. This list should be pruned first.

Database migrations

- Some rollback scripts are sitting in the main migrations folder instead of the rollback folder. Running the migrations in order would execute them and drop tables. Check every file's location before applying anything.
- The migrations folder does not perfectly describe the live database — some recorded migrations never ran, and some live structures have no migration file. **Always check the live database, never the folder.**

Smaller known issues

- On the will Review screen, several "Edit" links point one step away from where they should.
- Adding guardians is not capped in the screen but is capped at three by the validation rules, and the resulting error has nowhere to display — so it can become a silent dead end.
- "Unreachable" appears in the lead edit dropdown but is missing from the validation list, so saving it does nothing.
- Removing a co-assignee does not save unless the main owner also changed.
- The Deny button on the leave summary widget navigates instead of denying.
- The attendance export's leave filter includes leave from outside the chosen period.
- The conversion funnel does not count "unreachable" leads, which makes one figure display incorrectly.
- A viewed invoice can show a placeholder line item instead of the real ones.
- Revenue charts group by the month the lead was created rather than the month payment arrived.

Waiting on the client

- The court-format will template.
- The bilingual (English + Arabic side by side) will.
- The branded proposal template.

WHAT HAS BEEN PROVEN, AND WHAT HAS NOT

Logic and data can be and have been checked directly — real payments read back from the card provider, real database queries, real sign-ins. What cannot be checked without opening a browser is anything that only goes wrong once it is drawn on screen: broken table layouts, a link to a page that does not exist, a message showing a placeholder instead of a number. Every bug that has reached a user so far has been of that second kind.

21 Quick reference — every page

Public

Address	Page
/	Landing page: hero, benefits, how it works, security, FAQ, footer
/intake	Public enquiry form (also the QR code target)
/login	General sign-in
/payment/success	Shown after a successful payment
/payment/cancelled	Shown if the customer backs out
/payment/settled	Shown if there is nothing left to pay

Client portal

Address	Page
/client	Home: status banner, counts, activity, download
/client/will	The 11-step questionnaire
/client/documents	All their files
/client/documents/[id]	One file, previewed
/client/support	Message the team
/client/settings	Details, password, language
/client/auth · /signup · /reset · /verified	Sign in, sign up, reset, confirmation landing

Admin & wills

Address	Page
/admin	Admin dashboard
/admin/wills	All wills, filterable
/admin/wills/[id]	One will: answers, documents, status, history, notifications
/admin/wills/[id]/print	The printable will document
/admin/wills/reports	Will statistics
/admin/manage-users	User and role management (superadmin)
/admin/my-leave	The admin's own leave

Lead management & sales

Address	Page
/lead-management	Dashboard
/lead-management/leads	The pipeline: table or board view
/admin/lead-management/leads/[leadId]	One lead in full
/lead-management/sources	Lead sources and their salespeople
/lead-management/analytics	Funnel, revenue, pipeline board
/lead-management/reports	Reports and exports
/lead-management/intake-qr	Generate and print the QR code
/lead-management/settings	The five settings tabs
/admin/lead-management/salesperson/[id]	One salesperson's leads and numbers
/admin/salesperson/leads	A salesperson's own leads
/admin/salesperson/calendar	Meetings and reminders
/admin/salesperson/reports	Their own performance
/admin/salesperson/settings	Their account and Outlook connection

Finance

Address	Page
/finance	Dashboard: cards, charts, outstanding balances, tabs
/admin/finance/transactions	The transactions table
/finance/reports	Reports and exports
/finance/settings	Finance settings, including the weekly digest

HR

Address	Page
/hr	HR dashboard with alert cards
/hr/employees · /new · /[id] · /[id]/edit	Staff list, add, view, edit
/hr/departments	Departments
/hr/job-roles · /new · /[id]/edit	Job roles and their KPIs
/hr/documents	Documents and expiry alerts
/hr/attendance	Attendance calendar and alerts
/hr/attendance/employee/[id]	One person's attendance
/hr/leave	Requests and approvals
/hr/leave/balances	Balances per employee per type
/hr/leave/calendar	Who is away, when
/hr/leave/history/[employeeId]	One person's leave history
/hr/kpis · /new · /[id]/edit	KPI definitions
/hr/kpis/evaluations · /[employeeId]	Scoring
/hr/reviews · /new · /[id] · /[id]/edit	Quarterly reviews
/hr/reviews/monthly · /new · /[id] · /[id]/edit	Monthly reviews
/hr/reviews/compliance	Who has been reviewed
/hr/reports	HR reports
/hr/settings	The five settings tabs
/hr/settings/email-logs	Every email attempt
/my/leave	Any employee's own leave

Every HR, Finance and Lead Management address above also exists under [/admin/...](#) for users working from the unified admin menu.
